

## **Poisonous Plants for Horses Webinar**

**June 13, 2012**

**12:00-1:00 pm MT**

Webinar (can be viewed via any computer with internet access)

Dr. Anthony Knight will cover the important poisonous plants in the inter mountain area that are poisonous to horses, providing plant characteristics, the toxic principle in the plant, and the clinical signs that horses are likely to develop if they eat the plants. Whether you are turning a horse out to graze, taking a trail ride in the mountains, feeding hay, or deciding what trees to plant in or around your horse pasture, poisonous plants are always of concern. There are numerous native wild flowers and noxious weeds that can cause poisoning in horses that eat them. In addition some common desirable trees and shrubs used in landscaping can be hazardous to horses.

Presented by Dr. Tony Knight, CSU Clinical Science Professor and author of several poisonous plant books.
